CS-5340/6340, Written Assignment #2 DUE: Wednesday, September 21, 2016 by 11:00pm

1. (15 pts) The table below contains frequency values for a set of nouns referring to trees in an imaginary text corpus. Fill in the table below with the unsmoothed probability of each noun, as well as the smoothed frequency and smoothed probability of each noun using add-one smoothing. You should assume that the vocabulary consists only of the nouns listed below.

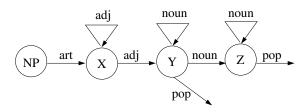

IMPORTANT: Please show the fraction (numerator/denominator) used to compute each value as well as the final value (e.g., 2/4 = .50).

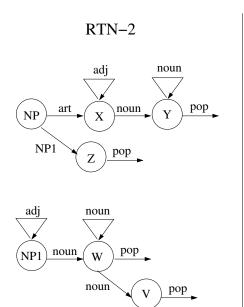

NOUN	FREQ	UNSMOOTHED	SMOOTHED	SMOOTHED
		PROB	\mathbf{FREQ}	PROB
maple	600	600/1200 = 0.5	$601 * \frac{1200}{1205} = 598.5$	601/1205 = 0.4987
oak	400	400/1200 = 0.33	$401 * \frac{1200}{1205} = 399.34$	401/1205 = 0.3327
pine	180	180/1200 = 0.15	$181 * \frac{1200}{1205} = 180.25$	181/1205 = 0.1502
spruce	20	20/1200 = 0.0167	$21 * \frac{1200}{1205} = 20.91$	21/1205 = 0.0174
aspen	0	0	$1 * \frac{\bar{1}\bar{2}00}{1205} = 0.99$	1/1205 = 0.00082

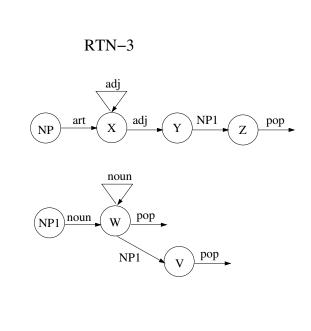

2. (16 pts) Consider the three Noun Phrase (NP) grammars and the three recursive transition networks (RTNs) below:

Grammar A	Grammar B	Grammar C
$NP \rightarrow art NP1$	NP →NP1	NP →NP1
$NP1 \rightarrow adj NP1$	$NP1 \rightarrow art NP2$	$NP1 \rightarrow art NP2$
$NP1 \rightarrow NP2$	$NP1 \rightarrow NP2$	$NP2 \rightarrow adj NP2$
$NP2 \rightarrow noun$	$NP2 \rightarrow adj NP2$	NP2 →adj NP3
$NP2 \rightarrow noun NP2$	$NP2 \rightarrow NP3$	NP3 →noun
	$NP3 \rightarrow NP4$	NP3 →noun noun
	NP4 →noun NP4	NP3 →noun NP3
	NP4 →noun	

RTN-1

Each grammar and RTN accepts a noun phrase "language" consisting of sequences of part-of-speech (POS) tags that are considered to be legal noun phrases. For example, "adj art noun" might be a POS tag sequence in a noun phrase.

For each pair below, indicate whether they accept exactly the **SAME** NP language or **DIF-FERENT** NP languages (i.e., do they accept exactly the same set of POS tag sequences or not). If you answer **DIFFERENT**, then briefly (1 sentence) explain how they are different and give an example of a POS tag sequence that is accepted by one of them but not the other (be sure to say *which* grammar or RTN would accept the example you give).

(a) Grammar A and Grammar B

DIFFERENT.

Grammar A: $art (adj)^*(Noun)^+$, it can accept art adj noun, here the article is must in all noun phrases.

Grammar B: this one can accept any grammar without any POS tag, NP= ϕ , and also it may or may not start with an article.

(b) Grammar A and Grammar C

DIFFERENT.

Grammar A: $art (adj)^*(Noun)^+$, it can accept art noun.

Grammar C: $art (adj)^+(Noun)^+$, is can take any grammar with at least one adj there, NP= $art \ adj \ noun$

(c) Grammar A and RTN-2

DIFFERENT

Grammar A: $art (adj)^+(Noun)^+$, it can accept art adj noun

RTN-2: It could start directly from Noun. NP = Noun

(d) Grammar A and RTN-3

DIFFERENT.

Grammar A: $art (adj)^*(Noun)^+$, it can accept art noun

RTN-3: $art (adj)^+(Noun)^+$, is can take any grammar with at least one adj there, NP= $art \ adj \ noun$

(e) Grammar B and RTN-2

SAME.

(f) Grammar C and RTN-1

DIFFERENT.

Grammar C: $art (adj)^+(Noun)^+$, is must end with noun, NP= art adj noun

RTN-1: $art (adj)^* (Noun)^+$, here without noun is fine. NP= art adj

(g) Grammar C and RTN-3

SAME.

(h) RTN-1 and RTN-3

DIFFERENT.

RTN-1: $art (adj)^* (Noun)^+$, here without noun is fine. NP= art adj

RTN-3: $art (adj)^+ (Noun)^+$, is can take any grammar with at least one adj there, NP= art adj noun

3. (24 pts) Consider the following three sentences with assigned part-of-speech tags to be a (tiny!) text corpus. Treat the words as being case-insensitive (so "the" is the same as "The").

A/ART young/ADJ girl/NOUN helped/VERB an/ART old/ADJ woman/NOUN cross/VERB the/ART street/NOUN . The/ART old/ADJ woman/NOUN thanked/VERB the/ART young/ADJ girl/NOUN and/CONJ gave/VERB her/PRO five/NUM dollars/NOUN . The/ART girl/NOUN thanked/VERB the/ART old/ADJ woman/NOUN and/CONJ gave/VERB her/PRO a/ART big/ADJ hug/NOUN .

We define unigram, bigram, trigram, and lexical generation probabilities as:

Lexical Unigram: $P(w_i)$ means probability of word w_i

POS Unigram: $P(t_i)$ means probability of POS tag t_i

Lexical Bigram: $P(w_i \mid w_{i-1})$ means probability of word w_i following word w_{i-1}

POS Bigram: $P(t_i | t_{i-1})$ means probability of POS tag t_i following POS tag t_{i-1}

Lexical Trigram: $P(w_i \mid w_{i-2} \mid w_{i-1})$ means probability of word w_i following words $w_{i-2} \mid w_{i-1}$

Lexical Generation Probability: $P(w_i \mid t_i)$ means probability of word w_i given tag t_i .

Compute the probabilities listed below. Please show each probability as a fraction (numerator/denominator)!

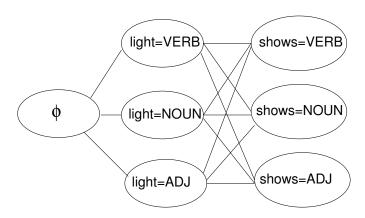

- (a) $P(the) = \frac{5}{34}$
- (b) $P(VERB) = \frac{6}{34}$
- (c) $P(young \mid girl) = 0$
- (d) $P(girl \mid young) = \frac{2/34}{2/34} = 1$
- (e) $P(and \mid woman) = \frac{1/34}{3/34} = 1/3$
- (f) $P(thanked \mid young \ girl) = 0$
- (g) $P(five \mid gave \ her) = 1/2$
- (h) $P(the \mid ART) = (5/34)/(\frac{8}{34}) = 5/8$
- (i) $P(cross \mid NOUN) = 0$
- (j) $P(thanked \mid VERB) = (2/34)/(\frac{6}{34}) = 1/3$
- (k) $P(NUM \mid PRO) = (1/34)/(\frac{2}{34}) = 1/2$
- (l) $P(ART \mid VERB) = (4/34)/(\frac{6}{34}) = 2/3$

4. (15 pts total) Use the following tables of probabilities to answer this question. Note that these numbers are completely fictional and not at all realistic! So don't worry that they don't make sense.

P(light NOUN)	.70
P(light VERB)	.50
P(light ADJ)	.20
P(shows NOUN)	.40
P(shows VERB)	.30
P(shows ADJ)	.10

$P(NOUN \mid \phi)$.60
$P(VERB \mid \phi)$.25
$P(ADJ \mid \phi)$.15
P(NOUN NOUN)	.80
P(NOUN VERB)	.30
P(NOUN ADJ)	.60
P(VERB NOUN)	.50
P(VERB VERB)	.40
P(VERB ADJ)	.10
P(ADJ NOUN)	.20
P(ADJ VERB)	.70
$P(ADJ \mid ADJ)$.90

Assume that there are only 3 possible part-of-speech tags: NOUN, VERB, and ADJ. The following network would be used by the Viterbi algorithm to find the most likely sequence of POS tags for the sentence "Light shows":

Using the Viterbi algorithm, compute the probability for each of the following nodes in the network. Show all your work!

(a) P(light=VERB)

$$= P(light|VERB) * P(VERB|\phi)$$
$$= 0.50 * 0.25$$
$$a = 0.125$$

(b) P(light=NOUN)

$$= P(light|NOUN) * P(NOUN|\phi)$$
$$= 0.70 * 0.60$$
$$b = 0.420$$

(c) P(light=ADJ)

$$= P(light|ADJ) * P(ADJ|\phi)$$
$$= 0.20 * 0.15$$
$$c = 0.030$$

(d) P(shows=VERB)

$$= P(shows|VERB)*\max(a*P(VERB|VERB),b*P(VERB|NOUN),c*P(VERB|ADJ))$$

$$= 0.30*\max(0.05,0.21,0.003)$$

$$= 0.063$$

(e) P(shows=NOUN)

$$= P(shows|NOUN)*\max(a*P(NOUN|VERB),b*P(NOUN|NOUN),c*P(NOUN|ADJ))$$

$$= 0.40*\max(0.0375,0.336,0.018)$$

$$= 0.134$$

(f) P(shows=ADJ)

$$= P(shows|ADJ) * \max(a * P(ADJ|VERB), b * P(ADJ|NOUN), c * P(ADJ|ADJ))$$

$$= 0.10 * \max(0.0875, 0.084, 0.027)$$

$$= 0.0087$$

Question #5 is for CS-6340 students ONLY!

- 5. (15 pts) For this question, use the same Viterbi network and probability tables shown in Question #4. Leave your answers in fractional form!
 - (a) Compute the lexical tag probability $P(light/VERB \mid light)$, which is the result of normalizing the forward probabilities in the Viterbi network.

$$P(light/VERB \mid light) = \frac{0.125}{(0.125 + 0.42 + 0.03)}$$
$$= 0.217$$

(b) Compute the lexical tag probability $P(light/NOUN \mid light)$, which is the result of normalizing forward probabilities in the Viterbi network.

$$P(light/NOUN \mid light) = \frac{0.42}{(0.125 + 0.42 + 0.03)}$$
$$= 0.73$$

(c) Compute the lexical tag probability $P(light/ADJ \mid light)$, which is the result of normalizing forward probabilities in the Viterbi network.

$$P(light/ADJ \mid light) = \frac{0.03}{(0.125 + 0.42 + 0.03)}$$
$$= 0.052$$

(d) Compute the lexical tag probability $P(shows/VERB \mid light shows)$, which is the result of normalizing the forward probabilities in the Viterbi network.

$$e = P(shows|VERB)*(a*P(VERB|VERB) + b*P(VERB|NOUN) + c*P(VERB|ADJ))$$

$$= 0.30*(0.05 + 0.21 + 0.003)$$

$$= 0.0789$$

$$f = P(shows|NOUN)*\sum(a*P(NOUN|VERB) + b*P(NOUN|NOUN) + c*P(NOUN|ADJ))$$

$$= 0.40*(0.0375 + 0.336 + 0.018)$$

$$= 0.1566$$

$$g = P(shows|ADJ)*\sum(a*P(ADJ|VERB) + b*P(ADJ|NOUN) + c*P(ADJ|ADJ))$$

$$= 0.10*(0.0875 + 0.084 + 0.027)$$

$$= 0.01985$$

$$e + f + g = 0.25535$$

$$P(shows/VERB \mid light \ shows) = \frac{e}{e + f + g}$$

$$= 0.30898$$

(e) Compute the lexical tag probability $P(shows/NOUN \mid light shows)$, which is the result of normalizing forward probabilities in the Viterbi network.

$$P(shows/NOUN \mid light \ shows) = \frac{f}{e+f+g}$$
$$= 0.6133$$

(f) Compute the lexical tag probability $P(shows/ADJ \mid light shows)$, which is the result of normalizing forward probabilities in the Viterbi network.

$$P(shows/ADJ \mid light \ shows) = \frac{g}{e+f+g}$$

$$= 0.0777$$

ELECTRONIC SUBMISSION INSTRUCTIONS

(a.k.a. "What to turn in and how to do it")

Your written assignment <u>must</u> be in .pdf format. Please do not turn in .doc or .docx files ... convert them to .pdf format before submitting them!

To submit this assignment, the CADE provides a web-based facility for electronic handin, which can be found here:

https://webhandin.eng.utah.edu/

Or you can log in to any of the CADE machines and issue the command:

handin cs5340 written2 <filename>

Please name your file: YourName-written2.pdf (e.g., EllenRiloff-written2.pdf)

HELPFUL HINT: you can get a listing of the files that you've already turned in via electronic submission by using the 'handin' command without giving it a filename. For example:

handin cs5340 written2

will list all of the files that you've turned in thus far. If you submit a new file with the same name as a previous file, the new file will overwrite the old one.
